

Boundary conditions

- INFLOW — subsonic stagnation: T_t, p_t , flow angle α
- WALL — inviscid slip, $\vec{v} \cdot \vec{n} = 0$ (thrust integrated here)
- · - · - AXIS — symmetry; same flux as WALL, tagged apart
- OUTFLOW — static p_b if subsonic, extrapolation if supersonic
- meshed half-domain (the lower half follows by symmetry)
